

SHORTCUT TO CALCULATING THE VALUE OF BOLT GROUP COEFFICIENT

In the design of Bolted Connection, calculating the Strength of a Bolt Group using I.C. Method (Instantaneous Center of Rotation) is a nightmare for most engineers. The process involves the determination of the value of 'C' that corresponds to the effective number of bolts in a Bolt Group subjected to Eccentric Load. Having no closed-form formula, the value of C is very infuriating to calculate; it requires the use of tables (Tables 7-7 ~ 7-14 in AISC 13th Edition) provided for by AISC Steel Construction Manual. The use of these tables to determine the value of C offers both ease and difficulty. The process becomes difficult when search values do not concur with the values on the tables – requiring designers to resort to 'inaccurate' linear interpolation.

Over a long period of time, in almost daily basis, I have struggled using this apparently crude method in my design work. In my desire to make my job much simpler and easier, I wrote Visual Basic Code (VBA) and finally solved the problem on finding the value of C without the use of tables. The program code is based on the discussion on pages 7-6 to 7-8 of AISC Steel Construction Manual 13th Edition. If you are a user of SteelPro's 'Connection Design Section' (as shown), the code that does the calculation of Bolt Group

Bolt Coefficient Weld Coefficient

Eccentrically Loaded Bolt Groups Tabulated Bolt Data [See Tables 7-7 to 7-14 of AISC Steel Construction Manual]

No.	Bolt Spacing on the Horizontal	Load Eccentricity	Load Angle from the Vertical [degrees]	Bolt Group Coefficient [C]	Bolt Group Coefficient [C']
1	3.000	2.500	45.000	9.347	69.229
2	3.000	5.000	35.000	14.628	116.544
3	3.000	2.500	45.000	9.347	69.229
4					
5	3.000	0.000	45.000	40.000	555.454
6	3.000	30.000	45.000	12.966	314.972
7	3.000	12.000	15.000	21.818	314.645
8					
9					
10					

Selected Inputs:

m	10	ex	2 1/2"
n	1		45.000°

Coefficient is the very same Visual Basic Code below. The code maybe embedded into

your Excel Workbook and recognized by Excel as user function -- behaving like any other excel built-in mathematical functions that calculate values in response to user's input. With the code implemented to your spreadsheet, all you have to do is to supply the necessary function arguments into assigned cells in your spreadsheet. Finally, you get rid of the cumbersome use of Bolt Coefficient Tables.

For complete instructions on how to embed the VBA Code into your Workbook, please visit my very young blog:
